

## Complex Analysis - Part 30

$f: \mathbb{C} \rightarrow \mathbb{C}$  holomorphic

with known values  $\{(z, f(z)) \mid z \in \partial B_r(z_0)\}$

$g: \mathbb{C} \rightarrow \mathbb{C}$  holomorphic with same values on  $\partial B_r(z_0)$

Cauchy's integral formula

$\implies f = g$  on  $B_r(z_0)$

Identity theorem:  $f, g: \mathcal{D} \rightarrow \mathbb{C}$  holomorphic,  $\mathcal{D} \subseteq \mathbb{C}$  open domain (connected).

Then:  $\{z \in \mathcal{D} \mid f(z) = g(z)\}$  has an accumulation point in  $\mathcal{D}$

$\iff$

$f = g$

$\iff$

There is  $c \in \mathcal{D}$  with  $f^{(n)}(c) = g^{(n)}(c)$  for all  $n = 0, 1, 2, \dots$

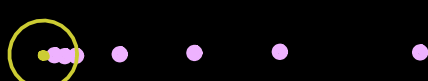

What is an accumulation point?

$p \in \mathcal{D}$  is called an accumulation point of the set  $M \subseteq \mathcal{D}$

if for all open set  $U$  with  $p \in U$ :  $U \setminus \{p\} \cap M \neq \emptyset$

$M = \mathbb{N}$   no accumulation point

$M = \left\{ \frac{1}{n} \mid n \in \mathbb{N} \right\}$   0 is accumulation point

Proof idea:  $h := f - g$  holomorphic. Show the equivalence of:

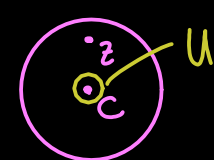

(1)  $M = \{ z \in \mathbb{D} \mid h(z) = 0 \}$  has an accumulation point in  $\mathbb{D}$

(2)  $h = 0$

(3) There is  $c \in \mathbb{D}$  with  $h^{(n)}(c) = 0$  for all  $n = 0, 1, 2, \dots$

(1)  $\Rightarrow$  (3) (Contraposition:  $\neg(3) \Rightarrow \neg(1)$ )

For each  $c \in \mathbb{D}$  there is a minimal  $m$  with  $h^{(m)}(c) \neq 0$

and  $h(z) = \sum_{k=m}^{\infty} \underbrace{\frac{h^{(k)}(c)}{k!}}_{a_k} (z-c)^k = a_m \cdot (z-c)^m + \dots$  

$\Rightarrow h(z) \neq 0$  for  $z \in U \setminus \{c\}$

$\Rightarrow U \setminus \{c\} \cap M = \emptyset$

(3)  $\Rightarrow$  (2)

$A_k := \{ z \in \mathbb{D} \mid h^{(k)}(z) = 0 \}$  closed  $\Rightarrow A := \bigcap_{k=0}^{\infty} A_k$  closed   
  $\neq_{(3)} \emptyset$

$A$  is also open:  $c \in A$  

$\mathbb{D}$  connected

$\Rightarrow A = \mathbb{D} \Rightarrow h = 0$

(2)  $\Rightarrow$  (1) ✓
