Linear Algebra - Part 29

$$A \in \mathbb{R}^{m \times n} \iff f_A : \mathbb{R}^n \to \mathbb{R}^m$$
 linear map

Identity matrix in Rhxh: Definition:

$$1 L_n = \begin{pmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & \vdots \\ \vdots & 0 & \ddots & \ddots & 0 \\ \vdots & \vdots & \ddots & \ddots & 0 \\ 0 & 0 & \cdots & 0 & 1 \end{pmatrix}$$

other notations:

Properties:

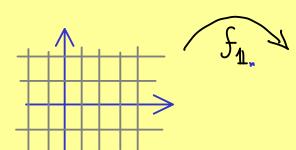

$$1 \frac{1}{n} = 3$$
 for $\beta \in \mathbb{R}^{n \times m}$ neutral element with respect to the matrix multiplication

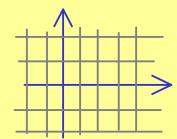

Map level:

$$\int_{\mathbf{1}_{n}} : \mathbb{R}^{n} \longrightarrow \mathbb{R}^{n}$$

$$\times \longmapsto \underbrace{\mathbf{1}_{n} \times \times}_{= \times}$$

$$\int_{\mathbf{1}_{n}} = identity map$$

Inverses:

$$A \in \mathbb{R}^{n \times n} \longrightarrow \widetilde{A} \in \mathbb{R}^{n \times n}$$
 with $A\widetilde{A} = 1$ and $\widetilde{A}A = 1$

If such a \widetilde{A} exists, it's uniquely determined. Write \widetilde{A}^1 (instead of \widetilde{A}) inverse of A

A matrix $A \in \mathbb{R}^{n \times n}$ is called invertible (= non-singular = regular) if the corresponding linear map $f_A: \mathbb{R}^n \longrightarrow \mathbb{R}^n$ is bijective. Otherwise we call A singular.

A matrix $\widetilde{A} \in \mathbb{R}^{h \times h}$ is called the inverse of A if $f_{\widetilde{A}} = (f_{A})^{-1}$ Write A^{-1} (instead of \tilde{A})

$$\begin{aligned}
f_{A^1} \circ f_A &= id \\
f_{A} \circ f_{A^{-1}} &= id
\end{aligned}$$

$$A^1 A = 1 \\
AA^1 &= 1$$
