

Linear Algebra - Part 41

$A \in \mathbb{R}^{m \times h}$ Gaussian elimination \rightsquigarrow row echelon form

$$\begin{pmatrix} x_1 & x_2 & x_3 & x_4 & x_5 & | & \\ \boxed{1} & 2 & 0 & 1 & 0 & | & 0 \\ 0 & 0 & \boxed{2} & -1 & 4 & | & 0 \\ 0 & 0 & 0 & \boxed{4} & 8 & | & 0 \\ 0 & 0 & 0 & 0 & 0 & | & 0 \end{pmatrix}$$

$$\Rightarrow \text{Ker}(A) = \left\{ x_2 \begin{pmatrix} -2 \\ 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} + x_5 \begin{pmatrix} 2 \\ 0 \\ -3 \\ -2 \\ 1 \end{pmatrix} \mid x_2, x_5 \in \mathbb{R} \right\}$$

Remember:

$$\begin{aligned} \dim(\text{Ker}(A)) &= \text{number of free variables} \\ + \\ \dim(\text{Ran}(A)) &= \text{number of leading variables} \\ &= h \end{aligned}$$

Proposition: For $A \in \mathbb{R}^{m \times h}$ and $b \in \mathbb{R}^m$, we have the following equivalences:

- (1) $Ax = b$ has at least one solution.
- (2) $b \in \text{Ran}(A)$
- (3) b can be written as a linear combination of the columns of A .

(4) Row echelon form looks like:

$$\begin{pmatrix} \text{---} & \text{---} & \text{---} & \text{---} & \text{---} & | & \text{---} \\ \text{---} & \text{---} & \text{---} & \text{---} & \text{---} & | & \text{---} \\ 0 & \dots & \dots & \dots & 0 & | & 0 \\ \vdots & & & & \vdots & & \vdots \\ 0 & \dots & \dots & \dots & 0 & | & 0 \end{pmatrix}$$

Proof: (1) \Leftrightarrow (2) given by definition of $\text{Ran}(A)$

(2) \Leftrightarrow (3) given by column picture of $\text{Ran}(A)$

$$\begin{aligned}\text{Ran}(A) &= \left\{ \begin{pmatrix} | & & | \\ a_1 & \cdots & a_n \\ | & & | \end{pmatrix} x \mid x \in \mathbb{R}^n \right\} \\ &= \left\{ x_1 \begin{pmatrix} | \\ a_1 \\ | \end{pmatrix} + \cdots + x_n \begin{pmatrix} | \\ a_n \\ | \end{pmatrix} \mid x \in \mathbb{R}^n \right\}\end{aligned}$$

(4) \Rightarrow (1)

Assume we have this: $\left(\begin{array}{ccc|c} \text{---} & \text{---} & \text{---} & \text{---} \\ \text{---} & \text{---} & \text{---} & \text{---} \\ \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 \end{array} \right)$

Then solve $\left(\begin{array}{ccc|c} \text{---} & \text{---} & \text{---} & \text{---} \\ \text{---} & \text{---} & \text{---} & \text{---} \\ \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 \end{array} \right)$ by backwards substitution.

(or argue with $\text{rank}(A) = \text{rank}((A|b))$)

(1) \Rightarrow (4) (let's show: $\neg(4) \Rightarrow \neg(1)$)

Assume: $\left(\begin{array}{ccc|c} \text{---} & \text{---} & \text{---} & \text{---} \\ \text{---} & \text{---} & \text{---} & \text{---} \\ \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & c \\ \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & c \end{array} \right)$ $\begin{matrix} \nearrow \text{not solvable} \\ \text{ } \end{matrix}$ $0 = c \quad \downarrow$
 \Rightarrow no solution for $Ax = b \quad \square$
