Linear Algebra - Part 54

$$A \in \mathbb{R}^{n \times n} \longleftrightarrow \mathbb{L}_{A} : \mathbb{R}^{n} \longrightarrow \mathbb{R}^{n}$$
 linear map
eigenvalue equation: $A \times = \lambda \cdot x$, $x \neq 0$
ptimal coordinate system: $A \in \mathbb{R}^{2 \times 2}$, $A \times = 2 \times$, $A y = 1 y$
 $u = a \cdot x + b \cdot y$
 $u = a \cdot x + b \cdot y$
 $A u = A(a \cdot x + b \cdot y)$
 $= a \cdot A x + b A y$
 $= 2a \times + 1b y$

How to find enough eigenvectors?

C

 $X \neq 0$ eigenvector associated to eigenvalue $\lambda \iff x \in \text{Ker}(A - \lambda 1)$ singular matrix

 $det(A - \lambda 1) = 0 \iff Ker(A - \lambda 1) \text{ is non-trivial}$ $\iff \lambda \text{ is eigenvalue of } A$

Example: (11) $(3-\lambda 2)$

$$A = \begin{pmatrix} 3 & 2 \\ 1 & 4 \end{pmatrix}, \quad A - \lambda \mathbf{1} = \begin{pmatrix} 1 & 4 - \lambda \end{pmatrix}$$

$$let \begin{pmatrix} 3-\lambda & 2 \\ 1 & 4-\lambda \end{pmatrix} = (3-\lambda)(4-\lambda) - 2$$
$$= 10 - 7\lambda + \lambda^{2}$$
$$= (\lambda - 5)(\lambda - 2) \stackrel{!}{=} 0$$

characteristic polynomial

$$\implies$$
 2 and 5 are eigenvalues of /

General case: For
$$A \in \mathbb{R}^{n \times n}$$
:
 $det(A - \lambda 1) = det\begin{pmatrix} a_{11} - \lambda & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} - \lambda & \vdots \\ \vdots & \ddots & \vdots \\ a_{n1} & \cdots & a_{nn} - \lambda \end{pmatrix}$

Leibniz formula

$$\stackrel{\forall}{=} (\alpha_{11} - \lambda) \cdots (\alpha_{1nn} - \lambda) + \cdots$$

 $= (-1)^{n} \cdot \lambda^{n} + C_{n-1} \lambda^{n-1} + \cdots + C_{1} \lambda^{1} + C_{0}$

Definition: For $A \in \mathbb{R}^{n \times n}$, the polynomial of degree n given by

$$p_{A}: \lambda \mapsto det(A - \lambda 1)$$

is called the characteristic polynomial of A .

Remember: The zeros of the characteristic polynomial are exactly the eigenvalues of A.
