The Bright Side of
Mathematics

Start Learning Numbers — Part 1

Natural numbers

$$1 \qquad 2 \qquad 3 \qquad 4$$

$$\mathbb{N} = \{1, 2, 3, 4, \ldots\}$$

$$\mathbb{N}_0 = \{0, 1, 2, 3, 4, \ldots\}$$

$0 := \emptyset$ empty set

$1 := \{0\}$ set with one element

$2 := \{0, 1\}$ set with two elements

$3 := \{0, 1, 2\}$ set with three elements

$4 := \{0, 1, 2, 3\} = 3 \cup \{3\}$

$\vdots$

Axiom: There is a set $\mathbb{N}_0$ with the properties: (a) $0 \in \mathbb{N}_0$

         (b) $\forall x: \; x \in \mathbb{N}_0 \longrightarrow x \cup \{x\} \in \mathbb{N}_0$

And $\mathbb{N}_0$ is the smallest set having these two properties.

Successor map: $s: \mathbb{N}_0 \longrightarrow \mathbb{N}_0$
$$x \longmapsto x \cup \{x\} \qquad , \qquad s(6) = 7$$

Start Learning Numbers — Part 2

Natural numbers: $\mathbb{N}_0 = \{0, 1, 2, 3, 4, \ldots\}$

Properties of $\mathbb{N}_0$:

(1) $0 \in \mathbb{N}_0$

(2) There is a map $s: \mathbb{N}_0 \to \mathbb{N}_0$ that satisfies:

(2a) s is injective

(2b) $0 \notin \text{Ran}(s) = s[\mathbb{N}_0]$

(2c) If $M \subseteq \mathbb{N}_0$ with
$0 \in M$ and $s[M] \subseteq M$,
then $M = \mathbb{N}_0$.

(mathematical induction)

$\mathbb{N}_0$

0 1 2 3 4 5 6 7 8 $\ldots$

Addition in $\mathbb{N}_0$: map $\mathbb{N}_0 \times \mathbb{N}_0 \longrightarrow \mathbb{N}_0$

$(m, n) \longmapsto m + n$

How is it defined? $2 + 4 := 6$

$\boxed{m + 0 := m}$, $m + 1 := s(m)$, $m + 2 := s(m+1)$

Recursive definition: $\boxed{m + s(n) := s(m+n)}$

$2 + 5 = 2 + s(4) = s(2+4) = s(6) = 7$

Dedekind's principle of recursive definition:

For a set A, $a \in A$ and $h: A \to A$, then there exists a unique map
$f: \mathbb{N}_0 \to A$ with $f(0) = a$ and $f(s(n)) = h(f(n))$.

$\left(\text{"} \ a, h(a), h(h(a)), h(h(h(a))), \ldots \text{"} \right)$

The Bright Side of
Mathematics

Start Learning Numbers – Part 3

Natural numbers: $\mathbb{N}_0 = \{0, 1, 2, 3, 4, \ldots\}$

Each $n \in \mathbb{N}_0$ has a unique successor:

$$s: \mathbb{N}_0 \to \mathbb{N}_0 \quad , \qquad s(n) = n + 1$$

We already know: $\quad m + (n+1) = (m+n) + 1 \qquad$ (RD)

Mathematical induction:

$\mathbb{N}_0$ satisfies the induction property:

Let $P(n)$ be a property for natural numbers n ("predicate").

If: (1) $P(0)$ is true   (base case)

   (2) $\forall n \in \mathbb{N}_0 : P(n) \to P(n+1)$ is true   (induction step)

Then: $P(n)$ is true for all $n \in \mathbb{N}_0$ $(\forall n : P(n)$ is true $)$

0
(base case)

n n+1
(induction step)

Proposition: For all $k, m, n \in \mathbb{N}_0$, we have:

$$(k + m) + n \quad = \quad k + (m + n) \qquad \text{(associative law)}$$

Proof: Use mathematical induction.

$P(n)$ is given by:

$$\forall k, m \in \mathbb{N}_0 : \quad (k+m) + n = k + (m+n)$$

Base case: $P(0)$ means $\quad \forall k, m \in \mathbb{N}_0 : \quad \underbrace{(k+m)}_{k+m} + 0 = k + \underbrace{(m+0)}_{m}$

$$\Leftrightarrow \quad \forall k, m \in \mathbb{N}_0 : \quad k + m = k + m \qquad \underline{\text{true}}$$

Induction step: $(\forall n \in \mathbb{N}_0 : P(n) \to P(n+1))$

Assume $P(n)$ is true.

$\boxed{m + (n+1) = (m+n) + 1 \qquad \text{(RD)}}$

$P(n+1)$ means $\quad \forall k, m \in \mathbb{N}_0 : \quad (k+m) + (n+1) = k + (m + (n+1))$

Left-hand side: $(k+m) + (n+1) \overset{\text{(RD)}}{=} ((k+m) + n) + 1$

$$\overset{P(n)}{=} (k + (m+n)) + 1$$

Right-hand side

$$\overset{\text{(RD)}}{=} k + ((m+n) + 1) \overset{\text{(RD)}}{=} k + (m + (n+1))$$

Start Learning Numbers — Part 4

Natural numbers: $\mathbb{N}_0 = \{0, 1, 2, 3, 4, \dots\}$

Addition $+$ is a map $\mathbb{N}_0 \times \mathbb{N}_0 \longrightarrow \mathbb{N}_0$ with:

- $m + 0 = m$ (neutral element)
- $(k + m) + n = k + (m + n)$ (associative law)
- $m + n = n + m$ (commutative law)

__Ordering:__ We write $n \leq m$ if:

$\exists k \in \mathbb{N}_0 : \quad m = n + k$

And we write $n < m$ if: $\quad n \leq m \quad \wedge \quad n \neq m$

$$0 < 1 < 2 < 3 < 4 < 5$$

__Properties:__

(1) $n \leq n$ (reflexive)

(2) If $n \leq m \wedge m \leq n$, then $n = m$ (antisymmetric)

(3) If $n \leq l \wedge l \leq m$, then $n \leq m$ (transitive)

Proof: Assume $n \leq l$ and $l \leq m$ are true. So:

$\exists k_1 \in \mathbb{N}_0 : \quad l = n + k_1$ and $\exists k_2 \in \mathbb{N}_0 : \quad m = l + k_2$ are true.

Therefore: $\quad m = l + k_2 = (n + k_1) + k_2$

$$= n + \underbrace{(k_1 + k_2)}_{=: k \in \mathbb{N}_0} = n + k$$

Therefore: $\exists k \in \mathbb{N}_0 : \quad m = n + k$ is true, so $\quad n \leq m$ is true.

Start Learning Numbers – Part 5

Natural numbers: $\mathbb{N}_0 = \{0, 1, 2, 3, 4, \dots\}$

$$\underbrace{4 + 4 + 4 + 4 + 4}_{\text{We have } 5 \text{ of them}} =: 5 \cdot 4$$

$$3 + 3 + 3 + 3 + 3 + 3 =: 6 \cdot 3$$

$$4 =: 1 \cdot 4$$

$$0 =: 0 \cdot 4 \qquad \text{How can we define the multiplication?}$$

Multiplication in $\mathbb{N}_0$: map $\mathbb{N}_0 \times \mathbb{N}_0 \longrightarrow \mathbb{N}_0$

$$(n, m) \longmapsto n \cdot m \qquad \text{defined by}$$

$$0 \cdot m := 0$$
$$(n+1) \cdot m := (n \cdot m) + m$$

(recursive definition)

$$5 \cdot 2 = 2 + 2 + 2 + 2 + 2$$
$$6 \cdot 2 = \underbrace{2 + 2 + 2 + 2 + 2}_{5 \cdot 2} + 2$$

successor

(Map is well-defined by Dedekind's recursion theorem)

Properties: (1) $n \cdot (m \cdot k) = (n \cdot m) \cdot k$ (associative)

(2) $n \cdot m = m \cdot n$ (commutative)

(3) $1 \cdot m = m$ (neutral element)

How to connect $+$ and $\cdot$: $n \cdot (m + k) = n \cdot m + n \cdot k$ (distributive)

$$\boxed{\begin{array}{l} 0 \cdot m := 0 \\ (n+1) \cdot m := (n \cdot m) + m \end{array}}$$
(*)

Proof by induction: Base case: $n = 0$

Left-hand side: $0 \cdot (m + k) = 0$ ✓

Right-hand side: $0 \cdot m + 0 \cdot k = 0 + 0 = 0$ ✓

Induction step: Assume $n \cdot (m + k) = n \cdot m + n \cdot k$ holds for n.

(induction hypothesis)

Left-hand side: $(n+1) \cdot (m + k) \overset{(*)}{=} n \cdot (m + k) + (m + k)$

$$\overset{(i.h.)}{=} n \cdot m + (n \cdot k + m) + k$$

$$= (n \cdot m + m) + (n \cdot k + k)$$

$$\overset{(*)}{=} (n+1) \cdot m + (n+1) \cdot k \qquad \leftarrow \text{Right-hand side}$$

The Bright Side of
# Mathematics

Start Learning Numbers — Part 6

$$5 - 2 = 3 \qquad\qquad 2 - 5 = ?$$

Idea: Look at pairs $(9,5)$, $(5,3)$, $(3,5)$

$$\mathbb{N}_0 \times \mathbb{N}_0 =: \mathbb{N}_0^2$$

$(5,3)$

$(4,2)$

$(3,1)$

$(2,0)$

should be the "same"

$(5,3)$ stands for "$5-3$"

$(4,2)$ stands for "$4-2$"

$5-3 = 4-2 \leftarrow$ not okay

$5+2 = 4+3 \leftarrow$ totally okay

$(5,3) \sim (4,2)$ (equivalent)

Equivalence relation: We write $(a,b) \sim (x,y)$ if:

$$a + y = x + b$$

Properties: (1) $(a,b) \sim (a,b)$ (reflexive)

(2) If $(a,b) \sim (x,y)$, then $(x,y) \sim (a,b)$.   (symmetric)

(3) If $(a,b) \sim (x,y)$ and $(x,y) \sim (c,d)$,

then $(a,b) \sim (c,d)$.   (transitive)

Box 0   Box 1
Box -1 Box 2

Property of $\mathbb{N}_0$ (cancellation):

If $m + n = \widetilde{m} + n$, then $m = \widetilde{m}$.

$$\text{Box } 0 = \big[(2,2)\big]_{\sim} := \Big\{ (x,y) \in \mathbb{N}_0^2 \ \big| \ (x,y) \sim (2,2) \Big\}$$

is called the <u>equivalence class</u> of $(2,2)$.

$\text{Box } 0 = \big[(0,0)\big]_{\sim} = \big[(2,2)\big]_{\sim}$ $\text{Box } -1 = \big[(0,1)\big]_{\sim} = \big[(8,9)\big]_{\sim}$

$\text{Box } 1 = \big[(1,0)\big]_{\sim} = \big[(9,8)\big]_{\sim}$ $\text{Box } -2 = \big[(0,2)\big]_{\sim}$

$\text{Box } 2 = \big[(2,0)\big]_{\sim}$

$\mathbb{Z} := $ set of all boxes (equivalence classes)

The Bright Side of
Mathematics

Start Learning Numbers − Part 7

In $\mathbb{N}_0$ $\quad 4 + x = 0 \quad$ is not solvable! No "inverse" of 4.

$$\mathbb{Z} := \left\{ [(a,b)]_\sim \mid (a,b) \in \mathbb{N}_0^2 \right\} =: \mathbb{N}_0^2 /_\sim$$

with $[(a,b)]_\sim := \left\{ (x,y) \mid (x,y) \sim (a,b) \right\}$

and $(x,y) \sim (a,b) \iff x + b = a + y$

$[(0,0)]_\sim =: 0_\mathbb{Z}$

$[(1,0)]_\sim =: 1_\mathbb{Z}$

$[(2,0)]_\sim =: 2_\mathbb{Z}$

$\vdots$

$[(0,1)]_\sim =: (-1)_\mathbb{Z}$
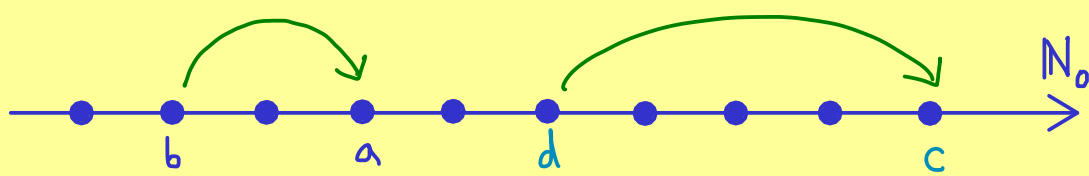

$[(0,2)]_\sim =: (-2)_\mathbb{Z}$

$\vdots$

$$\mathbb{Z} = \left\{ \dots, (-2)_\mathbb{Z}, (-1)_\mathbb{Z}, 0_\mathbb{Z}, 1_\mathbb{Z}, 2_\mathbb{Z}, \dots \right\}$$

Question: Is $\quad 4_\mathbb{Z} + x = 0_\mathbb{Z} \quad$ now solvable? And with $x = (-4)_\mathbb{Z}$?

First question: How is $+$ as a map $\mathbb{Z} \times \mathbb{Z} \longrightarrow \mathbb{Z}$ defined?

$$[(a,b)]_\sim + [(c,d)]_\sim := [(a+c, b+d)]_\sim$$

well−defined? ✓

Take $(\tilde{a},\tilde{b}) \sim (a,b)$ and $(\tilde{c},\tilde{d}) \sim (c,d)$. Then $[(\tilde{a},\tilde{b})]_\sim + [(\tilde{c},\tilde{d})]_\sim = [(\tilde{a}+\tilde{c}, \tilde{b}+\tilde{d})]_\sim$

Is $(\tilde{a}+\tilde{c}, \tilde{b}+\tilde{d}) \sim (a+c, b+d)$?

Proof: $(\tilde{a},\tilde{b}) \sim (a,b) \iff \tilde{a}+b = a+\tilde{b}$

$(\tilde{c},\tilde{d}) \sim (c,d) \iff \tilde{c}+d = c+\tilde{d}$

implies: $\tilde{a} + \tilde{c} + b + d = a + c + \tilde{b} + \tilde{d}$

$\iff (\tilde{a}+\tilde{c}, \tilde{b}+\tilde{d}) \sim (a+c, b+d)$

Examples: (a) $4_\mathbb{Z} + 2_\mathbb{Z} = [(4,0)]_\sim + [(2,0)]_\sim = [(6,0)]_\sim = 6_\mathbb{Z}$

(b) $4_\mathbb{Z} + (-4)_\mathbb{Z} = [(4,0)]_\sim + [(0,4)]_\sim = [(4,4)]_\sim = [(0,0)]_\sim = 0_\mathbb{Z}$

map $\mathbb{Z} \times \mathbb{Z} \to \mathbb{Z}$

Properties of $\mathbb{Z}$ together with $+$:

(a) associative

(b) commutative

(c) $m + 0_\mathbb{Z} = m$ ($0_\mathbb{Z}$ is neutral element)

(d) For all $m \in \mathbb{Z}$, there is an element $\tilde{m} \in \mathbb{Z}$ with $m + \tilde{m} = 0_\mathbb{Z}$

$(\mathbb{Z}, +)$ is an abelian group

The Bright Side of Mathematics

Start Learning Numbers — Part 8

$$\mathbb{Z} = \left\{ \ldots, (-2)_{\mathbb{Z}}, (-1)_{\mathbb{Z}}, 0_{\mathbb{Z}}, 1_{\mathbb{Z}}, 2_{\mathbb{Z}}, \ldots \right\}$$

$$2_{\mathbb{Z}} = \left[(6,4)\right]_{\sim} \quad \longleftarrow \text{ think of } \text{"} 6-4 \text{"}$$

$$\qquad\qquad\qquad \text{think of } \text{"}(a-b)\cdot(c-d) = (ac+bd) - (ad+bc)\text{"}$$

$$\left[(a,b)\right]_{\sim} \cdot \left[(c,d)\right]_{\sim} := \left[(a\cdot c + b\cdot d, \; a\cdot d + b\cdot c)\right]_{\sim}$$

The multiplication is well-defined.

$$\longleftarrow \text{ map } \mathbb{Z} \times \mathbb{Z} \to \mathbb{Z}$$

Properties of $\mathbb{Z}$ together with $\cdot$:

(a) associative

(b) commutative

(c) $1_{\mathbb{Z}} \cdot m = m$ ($1_{\mathbb{Z}}$ is neutral element)

(d) distributive

Examples: (a) $\quad 4_{\mathbb{Z}} \cdot 2_{\mathbb{Z}} = \left[(4,0)\right]_{\sim} \cdot \left[(2,0)\right]_{\sim} = \left[(4\cdot2 + 0\cdot0, \; 4\cdot0 + 0\cdot2)\right]_{\sim} = 8_{\mathbb{Z}}$

(b) $\quad (-4)_{\mathbb{Z}} \cdot (-2)_{\mathbb{Z}} = \left[(0,4)\right]_{\sim} \cdot \left[(0,2)\right]_{\sim} = \left[(0\cdot0 + 4\cdot2, \; 0\cdot2 + 4\cdot0)\right]_{\sim} = 8_{\mathbb{Z}}$

Start Learning Numbers — Part 9

$$\mathbb{Z} = \{\ldots -3, -2, -1, 0, 1, 2, 3, 4, \ldots\}$$
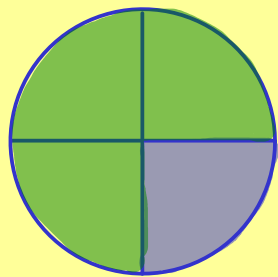

ratio: $3:1$ or $3:4$ or $1:4$

fraction: $\frac{3}{4} + \frac{1}{4} = 1$

Solve $4 \cdot x = 1$? $\rightsquigarrow$ We need inverses with respect to $\cdot$!

Works the same as $(\mathbb{N}_0, +) \rightsquigarrow (\mathbb{Z}, +)$

For $(c, d), (a, b) \in \mathbb{Z} \times \mathbb{Z} \backslash \{0\}$ define:

$$(a, b) \sim (c, d) \quad \text{by} \quad a \cdot d = c \cdot b$$

$\cdot 2$ $\cdot 2$

$\ldots$

$\ldots$ 0 1 2 3 4 5 6 7 8 9 $\mathbb{Z}$

$(6,3) \sim (2,1)$ "$\frac{6}{3} = \frac{2}{1}$"

$$\mathbb{Q} := \left(\mathbb{Z} \times \mathbb{Z} \backslash \{0\}\right)/\sim \; = \left\{ \left[(a,b)\right]_\sim \mid (a,b) \in \mathbb{Z} \times \mathbb{Z} \backslash \{0\} \right\}$$ rational numbers

Examples: $\left[(4,2)\right]_\sim = \left[(6,3)\right]_\sim = \left[(2,1)\right]_\sim =: 2_\mathbb{Q}$

$\left[(-9,-3)\right]_\sim = \left[(9,3)\right]_\sim = \left[(3,1)\right]_\sim =: 3_\mathbb{Q}$, $\left[(0,8)\right]_\sim = \left[(0,1)\right]_\sim =: 0_\mathbb{Q}$

$\left[(-9,3)\right]_\sim = \left[(-3,1)\right]_\sim =: (-3)_\mathbb{Q}$ We get all integers back!

$\left[(2,8)\right]_\sim = \left[(1,4)\right]_\sim =: \left(\frac{1}{4}\right)_\mathbb{Q}$ $\rightsquigarrow$ fractions

Definition: $\left[(a,b)\right]_\sim =: \frac{a}{b}$ $\left(\frac{2}{8} = \frac{1}{4} \right)$

The Bright Side of
Mathematics

Start Learning Numbers – Part 10

$$\mathbb{Q} = \left\{ \frac{a}{b} \;\middle|\; a \in \mathbb{Z}, \; b \in \mathbb{Z} \setminus \{0\} \right\}, \qquad \frac{a}{b} = \frac{c}{d} \iff a \cdot d = c \cdot b$$

Multiplication:
$$\frac{a}{b} \cdot \frac{c}{d} := \frac{a \cdot c}{b \cdot d} \qquad \text{well-defined!}$$

For $a \neq 0$, we have:
$$\frac{a}{b} \cdot \frac{b}{a} = \frac{a \cdot b}{b \cdot a} = \frac{1}{1} \quad \left(= 1_\mathbb{Q} \right)$$

Solve: $4 \cdot x = 1$? In $\mathbb{Q}$: $\frac{4}{1} \cdot x = \frac{1}{1}$ is solved by: $x = \frac{1}{4}$

Property: $\left(\mathbb{Q} \setminus \{0_\mathbb{Q}\}, \cdot \right)$ is an <u>abelian group</u>.

How to define the addition?

We want the distributive law:

$$\boxed{\frac{a}{d} + \frac{c}{d}} = \frac{a}{1} \cdot \frac{1}{d} + \frac{c}{1} \cdot \frac{1}{d} = \left(\frac{a}{1} + \frac{c}{1} \right) \cdot \frac{1}{d} = \boxed{\frac{a + c}{d}}$$

should be defined by:

$$\frac{a}{b} + \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{d} + \frac{c}{d} \cdot \frac{b}{b} = \frac{a \cdot d}{1} \cdot \frac{1}{b \cdot d} + \frac{c \cdot b}{1} \cdot \frac{1}{b \cdot d}$$

$$= \left(\frac{a \cdot d}{1} + \frac{c \cdot b}{1} \right) \cdot \frac{1}{b \cdot d} = \frac{a \cdot d + c \cdot b}{b \cdot d}$$

Define:
$$\frac{a}{b} + \frac{c}{d} := \frac{a \cdot d + c \cdot b}{b \cdot d} \qquad \text{well-defined!}$$

Proposition: The set $\mathbb{Q}$ together with the operation $+$ and $\cdot$ satifies:

(1) $\left(\mathbb{Q}, + \right)$ is an abelian group

(2) $\left(\mathbb{Q} \setminus \{0_\mathbb{Q}\}, \cdot \right)$ is an abelian group

(3) distributive law
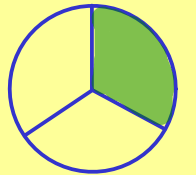

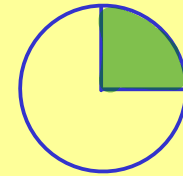

$\left.\rule{0pt}{2.5em}\right\}$ <u>field</u>

The Bright Side of
Mathematics

Start Learning Numbers — Part 11

$$\mathbb{Q} = \left\{ \frac{a}{b} \;\middle|\; a \in \mathbb{Z},\; b \in \mathbb{Z}\backslash\{0\} \right\}$$

$\leq$

We need to define it

Definition of $\leq$ for $\mathbb{Z}$: For $a, b \in \mathbb{Z}$, we write $a \leq b$ if $\exists k \in \mathbb{N}_0 : a + k = b$

Now: $\dfrac{1}{4} \leq \dfrac{1}{3}$ because $3 \leq 4$

Definition of $\leq$ for $\mathbb{Q}$: For $b > 0$ and $d > 0$

$$\frac{a}{b} \leq \frac{c}{d} \quad \text{defined by} \quad a \cdot d \leq c \cdot b$$

Properties of $\leq$ for $\mathbb{Q}$:

(1) Ordering: reflexive, antisymmetric and transitive.

(2) For all $x, y, z \in \mathbb{Q}$: If $x \leq y$, then $x + z \leq y + z$

(3) For all $x, y, z \in \mathbb{Q}$: If $z \geq 0$ and $x \leq y$, then $x \cdot z \leq y \cdot z$

(4) Total order: For all $x, y \in \mathbb{Q}$, we have $x \leq y$ or $y \leq x$.

(5) Archimedean property: For all $x, \varepsilon \in \mathbb{Q}$ with $x > 0$ and $\varepsilon > 0$,

we have: $n \in \mathbb{N}_0 : n \cdot \varepsilon = \varepsilon + \varepsilon + \varepsilon + \cdots + \varepsilon > x$
